Spray vaccinator

Vaccination against Infectious
Bronchitis and Newcastle disease

Benefits

By creating a mist of vaccine due to the combination with compressed air, maximum inhalation of the vaccine by the chicks is ensured. A transparent drift guard ensures an ideal spray-image, avoiding vaccine drift and wastage. A detection system automatically registers the presence of a chick box, so that spray is only applied when chicks are present. The unit is easily refilled during operation

How it works

- This automatic spray unit may be placed using a bridge over the output conveyor of the chick counting and boxing system or SmartCount system, for inline vaccination at the point of discharge or used as a standalone unit.
- Compressed air vaccine spray is activated automatically as each chick box passes underneath.
- By inhaling the vaccine spray, day old chicks are protected against various diseases like Infectious Bronchitis and Newcastle Disease
